

Is Relief Really Waiting For You In The Medicine Cabinet?

The drug industry's massive media campaign has gone a long way towards convincing the American public that the "correction of health problems can be found in a bottle."

The average American family has 29 different drugs in their medicine cabinet and Americans consume over half the drugs in the world at the rate of 25 million per hour.

Fortunately, there is an escalating awareness that has swept the country. We are finding an increasing number of people who don't want to "cover up" the "warning signals" from the body. They don't want to face a drug dependency for the balance of their life. They are looking for the "*cause*" of the "warning signals" (symptom) they are experiencing.

The most vulnerable part of the nervous system is in the spine where branching nerves pass through openings between vertebrae and go to serve all the parts of the body. Misaligned vertebrae cause pressure on the nerve and cause the "warning signals" in the part of body served by that nerve.

Yes, potions and lotions may give you instantaneous relief in the short term, but does nothing to remove the cause of the interference (a bone out of place putting pressure on a nerve) to nervous system. When the drug has worn off, you must take more drugs, contemplate surgery, or "learn to live with it."

Can you imagine the long range side effects of an asthmatic child taking drugs for 20, 30, 40, 50 or more years? Ask yourself, what you would do if the child was yours.

"If all the medicine in the world were thrown into the sea, it would be bad for the fish and good for humanity" O.W. Holmes, M.D.

It's better to have your spine checked to ensure you do not have interference to your Nerve System, than to live a life of putting your faith in pills, potions, and lotions.

Fight drug dependency, don't back slide into thinking relief is in the medicine cabinet. The real key to health is the reduction and/or elimination of subluxations. Call Brooke today for a complimentary spinal check up, to determine if you have a subluxation (a bone out of place putting pressure on a nerve) causing a miscommunication between the brain and the rest of the body. **Give your body the chance to function up to its optimum genetic maximum potential—Health.**

Yours in Health and Service,

Dr. Thiede
